

The prototype opens successfully using the FinalPrototype.html file without any loading issues. The welcome screen is clear and includes the game title, instructions, and a start button. The instructions are easy to understand, and users can follow the game flow without confusion. All buttons and interactions work correctly when clicked. Correct answers display positive feedback, while wrong answers provide helpful explanations to support learning. The feedback clearly explains cyber-security concepts such as phishing and password safety. The game also includes a score system and success message to motivate users. The design is suitable for the target audience because it uses simple navigation, readable text, bright visuals, and interactive challenges appropriate for users aged 18–25. Before submission, the group still needs to improve the presentation slides to make them more attractive, professional, and clear during the final demonstration. Here is the table that I tested and their evidence in the below

.2 Testing record template		
Testing question	Yes/No	Notes / evidence
Does the prototype open or start correctly?	Yes	Final prototype.html
Is the welcome/title screen clear?	Yes	
Are the instructions easy to understand?	Yes	

Can the player understand what to do next?	Yes	
Do the choices/buttons/interactions work?	Yes	
Does the correct answer show correct feedback?	Yes	
Does the wrong answer show helpful feedback?	Yes	

Does the feedback explain the cyber-safety lesson?	Yes	
Is there a reward, score, star, level, or success message?	Yes	
Is the design suitable for the target audience?	Yes	The design uses simple navigation, readable text, bright visuals, and interactive challenges that are suitable and engaging for the age group between 18 to 25

503IT Communication and Collaboration | Week 4 Final Game Completion Task Pack

What needs improvement before submission?	Yes	We have to make our presentation most attractive and clear.
